1. What is the AT command

AT command is used for controlling module. You can use AT command to configure and query the settings.

2. How to use the AT command

For USR device is in transparent mode normally, you must enter AT command mode at first. Then you can send AT command to configure or query the settings. After you configure the USR device, you should restart the USR device to make the settings take effect. Every time module restart will work in work mode rather AT command mode.

Every AT command must add character carriage return <CR> and line feed <LF>. In Hex, <CR> is 0x0D <LF> is 0x0A.

2.1. How to enter AT command mode

AT commands including network AT commands and serial AT commands.

2.2. Network AT Command

When the N580 device and the computer in the same LAN network, can send network AT commands to set the parameters.

Send "WWW.USR.CN" from UDP port 48899, will receive the response data from module. Then can send AT commands to it directly. If there is no AT command sent within 30s, the module will exit AT commands mode automatically.

2.3. Serial AT Command

After power on the device, can send AT commands from the serial port. Serial parameters default to 115200, NONE, 8, 1.

Please read this FAQ about entering AT command mode: <https://www.pusr.com/support/faq/how-to-send-at-command>
