1. Introduction

1.1. Overview

The USR-M100-HM is an intelligent IoT I/O gateway with comprehensive functions like on-board I/O support and RS-485/232/Ethernet/4G interface, is an advanced modular RTU product with a unique hardware and software design, making it an ideal solution for a variety of industrial data acquisition applications.

The USR-M100-HM has a unique mechanical design that reduces the amount of time required for installation and removal, simplifying deployment and maintenance. In addition, the USR-M100-HM supports Modbus RTU Master protocol for retrieving field site serial data from serial meters and also supports OT/IT protocol conversion.

With the ability to convert between multiple protocols, USR-M100-HM can convert the collected I/O and serial data to protocols suitable for different upper-level software. For example, cloud service via MQTT, SCADA via Modbus TCP, web server via HTTP, and more. This two-in-one design reduces system complexity, the amount of space required in the network topology, and overall installation time. You can also connect your legacy devices to Ethernet, thereby increasing the lifetime of the devices since you can continue using the devices' original protocols.

USR-M100-HM Parameters Input Voltage DC:9~36V Power Power Idle: 200mA/12V, Max: 400mA/12V Consumption 1 * RS485 / RS232 Serial Port 1 * RS485 2 * Digital opto-isolated input DI High level: 9-36V, Low level: 0-2V. 1.4. Features

- High-performance CPU processing ability, up to 600MHz frequency
- Provides remote serial access over the Internet for industrial serial devices
- 10/100Mbps Ethernet port and support Auto MDI/MDIX
- Built-in 15KV ESD serial port protection
- Supports a wide industrial operating temperature,-40°C~85°C
- Baud rate: 0.6~230.4 Kbps, and any baud rate setting, support None, Odd, Even, Mark, Space Parity bit
- Flexible serial port data framing packing, which can satisfy user's various demands for data packets segmentation
- Versatile operation modes: TCP Server, TCP Client
- Provides rich configuration access, including: Windows configuration tool, and Web Browser
- Firmware upgrading via Web Browser and Windows configuration tool
- High security via certificate verification SSL/TLS encryption for serial data transmission, TCPS, MQTTS
- Support modbus RTU master, edge computing, modbus gateway, MQTT gateway
- Support on board I/O for analog input(2 AI), digital input(2 DI), digital output(SSR relay,2 DO), expandable with I/O modules
- Support 2 RS485 serial port, the first one can also be RS232
- Cloud support: MQTT via AWS IOT, Microsoft Azure, Thingsboard, Alibaba Cloud, EMQX, Tuya, Cumulocity IoT and so on

2. Get started

Since the USR-M100-HM is connected through a TCP/IP network, you may need to know some basic facts about networking in order to connect the server correctly.

2.1. Installation

You can choose whether to plug in the other peripheral ports at this point or do it later depending on the actual location of the device or level of comfort for performing such operation.

2.1.1. DIN-Rail mounting

The USR-M100-HM-HM has a unique mechanical design that reduces the amount of time required for installation and removal. In fact, screwdrivers and other tools are not required for any part of the hardware installation, including mounting the device on a DIN-rail, as well as connecting the wiring for both communication and I/O signal acquisition. Furthermore, no tools are required to remove the USR-M100-HM from a DIN-rail. Removing all of the modules from a DIN-rail is also easy using the latch and release tab.

Position the rear panel of the device directly in front of the DIN-Rail, making sure that the top of the clip hooks over the top of the DIN-Rail, as shown in Fig.1. Push up the the release tab towards the bottom of the DIN-Rail until the the mounting clip snaps into place.

Fig. 1 DIN-Rail mounting and wall mounting

- If you want to remove the device from DIN-Rail. Pull down the release tab with your finger and then remove the module from the DIN-Rail.
- NOTE: Disconnect all connections, including Ethernet, serial, and power cables, from the device before removing the device from the DIN rail.

2.1.2. Wall mounting

The wall mounting option provides better shock and vibration resistance than the DIN-Rail vertical mount.

- ♦ Locate the installation site and place the device against the wall. Use the wall mount plates as a guide to mark the locations of the screw holes.
- ♦ Drill two holes over the 4 marked locations on the wall. Insert the wall sinks into the walls.
- ♦ Insert the screws(M3 size) into the wall sinks then tighten the screw to enhance stability, see the following Fig.1.

2.2. Serial port

The USR-M100-HM supports 2 serial ports, 1 RS232/485 and 1 RS485, and adopts Spring-type terminal. The serial port pin assignments are shown in Fig.2. When connecting up Modbus devices via an RS485 network they should be daisy chained together, and a dual twisted pair cable are recommended. The connections should be kept the same throughout the network: positive to positive, and negative to negative. These may sometimes be labeled up as A and B. The maximum length of the serial network cannot exceed 1200m regardless of boosters and repeaters.

Fig. 2 USR-M100-HM interfaces

2.3. I/O interfaces

Your Tr

USR-M100-HM is equipped with two 11-pin Terminal blocks that are used for I/O interfaces. The pin assignments of terminal block are shown in table 1. The PIN assignments are also marked on the device' s nameplate, in order to avoid confusion.

	Terminal block1	Definition		Terminal block2	Definition
	DO1 NC	Relay Output 1 normal		A	COM 2 RS485 A
		close		В	COM 2 RS485 B
	DO1 COM	Relay Output 1 Common		G	COM 2 Ground
	DO1 NO	Relay Output 1 Normal		DI1	DC Digital Input 1
		open		СОМ	Digital Input 1 Common
	DO2 NC	Relay Output 2 normal		DI2	DC Digital Input 2
		close		СОМ	Digital Input 2 Common
	DO2 COM	Relay Output 2 Common		AI1	Analog Input 1
	DO2 NO	Relay Output 2 normal		СОМ	Analog Input 1 Common
is		open		AI2	Analog Input 2

2.3.1. I/O specifications

		Inputs
	DI channels	2
2	Input Type	Dry/Wet contact
	Wet contact	On: 9 to 36 VDC
Digital inputs		Off: 0 to 2 VDC
Digital inputs	Dry contact	On: close
		Off: open
	Range	9-36V DC
	Input filter time	Software configurable,10~65535ms
	Quantity	2
	Туре	Differential input
Analog inputs	Resolution	16 bit
	Range	4~20mA current
	Accuracy	1% FSR
		Outputs
	Quantity	2
	Туре	Form C SSR Relay
	AC Contact Current	10A / 277V AC at resistive load, NO
	Rating	5A / 250V AC at resistive load, NC
Digital outputs	DC Contact Current	10A / 28V DC at resistive load
	Rating	
	Operating time	10 ms max.
	Release time	5ms max.
	Mechanical Endurance	10000000 operations

Table 2I/O specification

2.3.2. I/O wiring

The left picture in Fig.3 shows an example of digital input (DI) dry contact in which the digital input channel is controlled by a switch that is wired to the COM pin of the DI port. An external DC power(9~36V) is supplied this external circuit via the wiring of DI pin and the switch. The position of switch and power supply can be interchanged.

8

Fig. 4 DI wire connection

Fig. 5 DO wire connection

Fig. 6 Al wire connection

NOTE:

-All DI channels should be configured to dry contact or wet contact in the same time

-wire range:28~16 AWG(0.2~0.1 mm²), strip length 10mm

2.3.3. Modbus address mapping table

The internal register map of USR-M100-HM field controller node is the data map of digital input and output and analog input module.

Table 3 IO modbus address

USR-M100-HM User Manual

Data points	M100-HM / IO	Start	Register	Function	Attribute	Data type	Default
	module	address	address	code			status
DO 1	USR-M100-HM	0000	00001	0x1,0x5,0xF	Write/read	Uint8	NC
DO 2	USR-M100-HM	0001	00002	0x1,0x5,0xF	Write/read	Uint8	NC
DO 3	IO Module	0002	0003	0x1,0x5,0xF	Write/read	Uint8	NC
	IO Module			0x1,0x5,0xF	Write/read	Uint8	NC
DI 1	USR-M100-HM	0000	10001	0x2	read	Uint8	0
DI 2	USR-M100-HM	0001	10002	0x2	read	Uint8	0
DI 3	IO Module						
AI 1	100	0000	30001	0x4	read	float32(ABCD)	0
AI 2	100	0001	30003	0x4	read	float32(ABCD)	0

2.4. Power supply

The USR-M100-HM I/O gateway provides 2-pin power supply input terminal. The power supply support anti-reverse protection. Power supply range: 9 ~ 36VDC.

2.5. Ethernet RJ45 interface

The 10Base-T/100Base-TX adaptive Ethernet RJ45 interface supports automatic MDI/MDIX connection, refer to Fig.7 below for the pin distribution of the RJ45 interface.

Link LED: green color. Lights(steady on) when the module is connected to a network.

Activity LED: orange color. Blinks when network data is transmitted through the port.

87654321

Fig. 7 RJ45 with light

Table 4Ethernet pin assignments

Pin number	Signal name
1	Send data+(TD+)
2	Send data-(TD-)
3	Receive data+(RD+)
6	Receive data-(RD-)
4,5,7,8	Unused

2.6. Cellular Network

The USR-M100-HM can also connect to the Internet via 4G/3G/2G cellular network. It's very convenient for users to run the projects that there are not Ethernet networks. Using cellular network, the 4G antenna is needed and a sim card should be installed in the slot. Push the side panel to the other side and you will see the SIM card slot. Open the slot, install the sim card

and lock the slot.

Note: SIM card installation requires the USR-M100-HM to be powered off.

2.7. Extended modules

The USR-M100-HM supports to extend the I/O ports using extension I/O modules. The USR-M100-HM supports up to 6 extension I/O modules and can be expanded to a maximum of 50 I/O ports. There are 5 different types of extension modules available for selection: 4DO+4DI, 4AI +4DO, 8DO, 8DI, 4AI+4AO.

M100-HM has a self-identification mechanism for the expansion module, which can quickly and automatically identify the expansion module model that is accessed, and compare it with the pre-configured sequence of the expansion module by the customer. If the sequence is wrong, the alarm can be given by the indicator light to prevent the application from being caused by the wrong location in the field installation process.

Note: After the expansion machine is connected to the M100 host, the RS485 port of the expansion machine cannot be used. Users can only collect and control the IO status of the expansion machine from M100 host.

The specific steps is as the follows:

1> Connect extended modules to M100 host

2> Power on USR-M100-HM, and configure the parameters on preconfigured page, and then save settings and restart the M100.

3> Users can check if the sequence is right on preconfigured page.

Model	USR-IO4040	USR-IO0440	USR-IO0080	USR-IO8000	USR-IO0404

Support extendable	\checkmark	\checkmark	\checkmark	\checkmark	\checkmark

2.8. LED indicators

The USR-M100-HM smart RTU provides LED indicators to monitor the device working status with a comprehensive simplified troubleshooting, the LED indicator behaviors are defined below.

LED name	status	description
POW	Steady on	Power supply is normal
	Off	No power supply or abnormal power supply
WORK	Blinking	Power is on and the device is ready. System is booted
		up and running
NET	Blinking	Ethernet WAN connection
	Steady on	4G LTE network connection
	off	No network
DATA	Blinking	Serial port is transmitting data
DO1	Steady on	Light on, the channel output is activated
DO2	Steady on	Light on, the channel output is activated
DI1	Steady on	Light on, the channel is activated by input signal
DI2	Steady on	Light on, the channel is activated by input signal

Table 5 LED indicators

2.9. Factory default settings

The USR-M100-HM remote IO module comes with the following default settings.

Table 6 Default parameters

Parameter	Default Values
User Name	admin
Password	admin
Device IP address	192.168.0.7
Subnet Mask	255.255.255.0
Gateway IP	192.168.0.1
COM port	9600,None,8,1
Socket function	Disable
MQTT	Disable
Edge computing	Disable

2.10. Quick test

USR-M100-HM has a built-in Web server, which provides a convenient way to access and configure the remote IO module. Users can use Edge, Firefox or Google browser to access it. This chapter is a quick introduction to the USR-M100-HM smart IO gateway. It is recommended that users read this chapter and follow the instructions once for the system, and you will have a basic understanding of the product. For specific function details and instructions, please refer to the subsequent chapters.

2.10.1.Download the software

Download the setting software from PUSR' s website:

https://www.pusr.com/support/downloads/H7-version-set-up-software.html

https://www.pusr.com/support/downloads/usr-tcp232-test-V13.html

You may find it in the download section under your product page. Run the software when the installation has been completed as shown in Fig.8 and Fig.9.

It is strongly recommended for the users to set the Network Parameters through configuration tool first. Other device-specific configurations can later be carried out via user-friendly Web-Interface.

2.10.2. Hardware connection

For fast networking of USR-M100-HM smart RTU, you need to prepare a PC, a router, a network cable, a serial cable, and a

DC12V/1A power supply. The hardware connection is shown in Fig.10. To establish a TCP / IP network all devices must be connected to the same network either locally or via gateway connections.

Fig. 9 Hardware connection

- Connect the power line with the USR-M100-HM power input. If the power is properly supplied, the "PWR" LED will show a solid red color. After the system is ready, the "WORK" LED will blink.
- Connect one end of the Ethernet cable to the M100-HM' s 10/100M Ethernet port and the other end of the cable to the same Ethernet network(same router or switch).
- Connect a serial data cable(USB to RS232 or RS485) between the USR-M100-HM and PC. Screwless push-in type connection for simple and easy connection.

Fig. 10 Push in type connector

2.10.3. Network configuration (Step1)

The Broadcast Search function is used to locate all USR-M100-HM gateways that are connected to the same LAN as your

computer. Since the Broadcast Search function searches by MAC address and not IP address, all M100-HM connected to the LAN will be located, regardless of whether or not they are part of the same subnet as the host.

Click Search to search for USR-M100-HM gateways. When your unit appears in the search results, you can click device to select it and change the IP type to DHCH, save your change. Wait for 5s and search it again.

Fig. 11 IP network setting

When accessing the M100-HM gateway through the Web, the IP address of the M100-HM gateway and the PC must be in the same network segment. After changing the IP address of the M100-HM gateway, you can access the Web page of the M100-HM gateway through browser and perform related configuration operations on it. The user name and initial password are both "admin". After entering the user name and password, click "OK" and the server will authenticate. After success, you will enter the main page of the Web server, as shown in Fig.12.

The IP address of the PC must be modified to ensure that it is in the same local area network as the IP of the M100-HM gateway if you want to connect M100-HM to PC directly via a net cable. The default IP address of M100-HM IO gateway is: 192.168.0.7. Set the PC's IP address as: 192.168.0.X (X is any valid value from 2 to 253 except 7). The specific Windows system operation page is shown in Fig.14. you can access the Web page of the USR-M100-HM gateway through browser as mentioned above.

2.11. Reload factory settings button

Press the "Reload" button (inside a small hole) on the back panel for 3-15 seconds and then release or follow the procedure in Section 3.1.9, to restore the USR-M100-HM gateway to the factory default settings.

2.12. Technical support and assistance

Please visit the USR IoT website: <u>https://www.pusr.com</u> where you can find the latest information about the product.

Contact your distributor, sales representative, or PUSR's support center:

<u>http://h.usriot.com/index.php?c=frontTicket&m=sign</u> for technical support if you need additional assistance. Please have the following information ready before you submit a ticket:

- Product model
- Description of your peripheral attachments
- Description of your software (firmware version, application, function description, etc.)
- A complete description of the issue and steps to reproduce

3. Configuration and parameter details

3.1. Web interface

The USR-M100-HM' s user-friendly web configuration tool was designed specifically to make configuration and reconfiguration easy; no reconfiguration effort is required for the unchanged modules.

Every USR-M100-HM Industrial IO gateway is equipped with a built-in web server in the firmware. Therefore, the device can be accessed by using a web browser for configuring by entering the device' s IP address in the URL field of your web browser. An authentication will be required and you will have to enter the username (Default value is "admin") and password (Default value is "admin") for accessing the web interface as shown in Fig. 16. This approach (web interface) for configuring your device is the most user-friendly. Please go to its corresponding section for a detailed explanation.

	ICCID:	

Fig. 15 Status

The function of the device status part is to display some specific information of the current device, including system, network, serial port, mqtt gateway and Edge computing status.

Table 7Overview status list

Parameter Item	Description			
System				
Model name	The name of the gateway, which can be customized by the user on the "Miscellaneous settings"			
	page.			
Firmware version	The current software version of the gateway.			
Туре	The current hardware version of the gateway.			
Running time	Total time after the device start work. It will starts from 0 after reboot.			
OS	Operating system.			
MAC address	The MAC address of the gateway.			
Current network type	Which interface to access the internet, default WAN interface, that is ethernet port.			
Ethernet				
Conn Status	If the Network cable is connected			
Network Type	DHCP or static			
Local IP address	The IP address of the gateway.			
LTE				
ICCID	If it's blank, indicating that the USR-M100-HM can't check the sim card or there's not			
	installation of the sim card.			
СІМІ	International Mobile Subscriber Identity			
Signal Value	The larger the value, the better the signal.			
Signal Strength	Another expression of signal value.			
Local IP Address	The IP address of the gateway based on cellular network.			
Network Type	Being used network standard.			
Connection Status	Whether connect to the cellular network			
TCP connection status				
Socket1	Whether socket1 is enable			
Socket2	Whether socket2 is enable			
MQTT connection status				
MQTT1	Whether MQTT1 is enable			
MQTT2	Whether MQTT2 is enable			
Cloud connection status				
Enable status	Whether PUSR cloud is enable			
Connection status	Connection status of Edge computing.			
	CONNECTING:M100-HM is connecting to PUSR cloud			
	CONNECTED: M100-HM has connected to PUSR cloud			

3.1.2. Network configuration

If using Ethernet port to connect to the Internet, you must assign a valid IP address to the USR-M100-HM before it will work in your network environment. The IP address must be unique within the network. If the device is connected to the Internet and should connect to other servers over the Internet to get some services such as Network Time Protocol (NTP) server, you will

need to configure the DNS server in order to be able to resolve the host name of the NTP server. The detailed description of the configuration parameters on this interface is shown in table 8.

Users can choose the network method according to their needs in network priority webpage. The settings of cellular network is in LTE Cat1 webpage.

					ttt\¥ English
					TTX Linguist
Current Status

	Alternate DNS Server	119.29.29.29			
			Apply&Save		

Fig. 16 Network web page

Table 8Network configuration list

Parameter Item	Description
Network priorit	EtherNET Only: Connect to the Internet via ethernet port(WAN). default setting.
у	EtherNET: Prefer to use Ethernet port for networking. If Ethernet port is not available, switch to cellular net
	work.
	LTE Cat1: Prefer to use cellular network for networking. If cellular network is not available, switch to Ethern
	et port.
IP obtaining	Click the drop-down menu to select the IP Address Setting mode: Static or DHCP. If you choose DHCP, the
type	rest of the options will be greyed out or disabled.
DNS type	Click the drop-down menu to select the DNS mode: auto or manual. If you choose auto, the DNS options
	will be greyed out or disabled.
IP address	IP address is a 32-bit address assigned to devices connected to the Internet. The IP address consists of two
	fields: the network number field (Net-id) and host number field (host-id). In order to facilitate the
	management of IP addresses, IP addresses are divided into five categories: Class A, B, and C addresses are
	unicast addresses, Class D addresses are multicast addresses, Class E addresses are reserved addresses for
	future special purposes. The IP addresses currently in large numbers belong to three types of addresses: A,
	B, and C.
Subnet mask	The mask is a 32-bit number corresponding to an IP address. Some of these numbers are 1, and the others
	are 0. The mask can divide the IP address into two parts: the subnet address and the host address. The part
	of the IP address corresponding to the 1 bit in the mask is the subnet address, and the other bits are the
	host address. The mask for class A addresses is 255.0.0.0, the mask for class B addresses is 255.255.0.0, the
	mask for class C addresses is 255.255.255.0.
Gateway	The default gateway in the host is usually called the default route. The default route (Default route) is the
	route chosen by the router when no other route exists for the destination address in the IP packet. All

	packets whose destination is not in the router's routing table will use the default route.
DNS	The IP address of the DNS server. DNS Server part is where you can specify the IP Address of your Preferred
	DNS (Domain Name Server) and Alternate DNS. When the device uses a static IP address, the user is
	required to fill in this item, 8.8.8.8(Google) will be a good choice. If a specific DNS server is not used, the
	default gateway IP address is generally sufficient.
LTE Cat1	APN Name: A string that identifies a particular service in the cellular network usually provided by operator.
	Username: Usually provided by operator.
	Password: Usually provided by operator.
	DNS: "Auto" means obtaining the DNS server from operator's base station. "Manual" means the DNS
	server is user-defined.

The configuration will save to flash memory after clicking Save button. All configurations take effect after a system reboot.

3.1.3. Serial port settings

The serial port module includes: serial port parameter configuration, network parameter configuration. The main function of the gateway is to carry out two-way transparent transmission of standard serial bus data (RS-232, RS-485) and standard Ethernet data supporting TCP/IP protocol to solve common serial equipment Networking problems on the Internet. The Port configuration page can configure the parameters of the serial port and socket, as shown in Fig.19. Details on work mode connectivity protocols and its settings of USR-M100-HM gateway are given in Chapter 4 Operation modes, this section will only focus on the part of parameter description. The description of the configuration parameters on this interface is shown in table 9 and table 10.

Current Status					
Network	UART SETTING				
∼Port	configure serial channel paramete	rs			
Uart					
>Communication	uarti uartz			 	
≻Gateway	Baud Rate	9600			
System Setting	Data Bits	8	~		
	Parity Bit	None	~		
	Stop Bit	1	~		
	Uart Function	South Collect Interface	~		

Fig. 17 Serial port configuration web page

Table 9Serial settings list

Parameter Item	Description
Baud rate	This sets the port's data transfer speed. Choices are from 600–230400. Set this to match the baud
	rate setting of the connected device. Default is 9600.
Data bits	This sets the number of bits used to transmit one character of data. Choices are: 7 and 8. Set this to
	match the data bit setting of the connected device. Default is 8 (which is the default for the majority
	of serial devices).
Parity bits	This bit checks the integrity of the transmitted data. Choices are: None, Odd, Even, Space, Mark. Set
	this to match the parity setting of the connected device. Default is None (which is the default for the
	majority of serial devices).

Stop bits	This indicates that a character has been transmitted. Set this to match the stop bit setting of the
	connected device. Choices are: 1 and 2. Default is 1 (which is the default for the majority of serial
	devices).
Uart Function	For now, it only support South Collect Interface

The configuration will save to flash memory after clicking Save button. All configurations take effect after a system reboot.

3.1.4. Socket function

For socket function, the device supports two working modes: TCP Client and TCP Server. And the device support two socket connections, each of which is configured and communicated independently. At the same time, each channel supports the independent network cache function. SSL encryption is valid for TCP client mode.

Current Status						
Network	Socket Setting					
∽Port	This section describes how to set	parameters of the Sock	et communication	channel		
Uart	Socket A Socket R					
ommunication	JUCKED

	SSL protocol	Close	~			
	Verify Mode	None	~			
	Offline cache	Close	~			

Fig. 18Socket configuration web pageTable 10Operation modes settings list

Parameter Item	Description
Socket enable	Whether the socket function is enabled
Working mode	USR-M100-HM gateway supports 2 different operation Modes which are TCP Server, TCP Client.
	The operation Mode describes the role of the device and the connection between the device and
	other remote devices in the network which would like to communicate with serial device on
	M100-HM' s COM port.
Maximum socket	This option specifies the maximum number of remote devices/clients (with maximum of 16 clients)
no.(TCP server only)	
Local port	This option specifies the port number that the TCP server should listen to. It is also used by the
	remote TCP client to connect to the TCP server. The default local port is 20108. You can enter
	different port numbers in this option.
Remoter server addr.	Please specify the IP address of the TCP server program on the remote host in this field. This should
	match the IP settings of the TCP server program.
Remote port	Please specify the port number of the TCP server program on the remote host in this field. Once
	again, this should match the IP setting of the TCP server program.

Re-connection Interval	If TCP client doesn't connect to TCP server, the device will connect in reconnection interval. The
(TCP client)	default is 5 seconds.
SSL protocol(TCP client)	Choose TLS/SSL data encryption protocol version
Offline cache	Whether to enable the offline cache function

The configuration will save to flash memory after clicking Save button. All configurations take effect after a system reboot.

3.1.5. MQTT connection

If you enable MQTT Broker as your northbound connection, the M100-HM gateway will be configured as MQTT Client. In Client mode, you can setup MQTT broker basic settings, TLS secure transmission, last will message.

Current Status	This supports SSL, clean session a	nd QOS, supports conne	cting to the third	party MQTT server.	
Network					
∽Port	MQTT1 MQTT2				
Uart	MQTT Enable	Open	v		
ommunication	MQTT Version	MQTT-3.1.1	~		
Socket	Client ID

Cloud	Remote Port	1883			
>Gateway	Keepalive	60			
System Setting	Reconnecting Interval	5			
	Clean up session				
	Connection Verification				
	Last Will				
	Offline cache	Close	~		
	SSL protocol	Close	~		
	Verify Mode	None	~		

Fig. 19 MQTT connection profiles

Table 11MQTT basic setting

Parameter Item	Description
Enable MQTT	Turns MQTT gateway on or off.
MQTT Version	Select the mqtt protocol version. V3.1 and V3.1.1 are supported.
Client ID	The client ID defined the identifier of the USR-M100-HM Gateway.
	The IDs of the various MQTT clients have to be unique for the respective MQTT Broker. If two
	MQTT clients are using an identical ID, the connections of theses clients to the MQTT Broker are
	disconnected. For an individual client, there is no way to find out whether a specific client ID is
	already used by another client or not.
Server address	IP address or hostname of an MQTT broker.
Remote Port	Port number of the MQTT broker.
Keep alive	The Keep Alive is a time interval measured in seconds. It is the maximum time interval that the
	broker permits between when a client finishes sending one MQTT packet and starts to send the
	next.
Re-connection interval	Automatic reconnection interval after a fail network connection.
Clean session	Valid only for Qos1 and Qos2. When the clean session is checked, the client does not want a
	persistent session. If the client disconnects for any reason, all information and messages that are

	queued from a previous persistent session are lost.
	When the clean session is unchecked, the broker creates a persistent session for the client. All
	information and messages are preserved until the next time that the client requests a clean
	session.
Connection Verification	If enabled, it needs user name and password.
User name	Username for authentication to the MQTT broker.
Password	Password for authentication to the MQTT broker.
Last will	The last will message is part of the Last Will and Testament (LWT) feature of MQTT. The will
	message notifies other clients when a client disconnects ungracefully.
Offline cache	Whether to enable the offline cache function, the default is off.
SSL/TLS	If you use a TLS connection, click the SSL/TLS tab, select Enable SSL/TLS, and then set
	the Protocol parameter to TLSv1.2

Table 12Publish message setting

Parameter Item	Description
Transmission mode	Transparent transmission, just as its name implies, the gateway does not process any data,
	forward the data directly.
	Topic distribution, in this mode users should define a topic name when configuring the topic.
	After receiving serial port data, the device pushes it to the associated topics based on the topic
	name. Topic name and payload are separated by comma. For example, topic name, {"message":
	"Hello from USR-M100-HM gateway"} as serial data. Different topics are allowed to have the
	same topic name. In this way, data is pushed to all topics with the same topic name.
	Custom mode, add topic, Qos(0,1,2), retain(ON,OFF) message before payload. After receiving the
	serial data, USR-M100-HM publishes the payload of the corresponding topic to cloud according
	to rules. This method can be used to publish any topic at any time. For example,
	awsiot/test,0,ON,{"message": "Hello
	from USR-M100-HM gateway"} as serial data.
TOPIC string	An MQTT topic is a UTF-8 string that the broker uses to filter messages for each connected client.
	To receive messages, the client must subscribe to the topic. A topic can have one or more topic
	levels. Each topic level is separated by a slash (Topic Level Separator).
Binding Port	The MQTT topic is bound to the serial port number of the device. Any data from the COM Port1
	of the gateway will send to all the TOPIC it bindings to.
Qos	QoS 0: at most once. In this case, the client publishes a message to the broker only once.
	QoS 1: at least once. In this case, when a client publishes a message to the broker, the client
	expects the broker to acknowledge whether or not a client has received the message. If the
	publisher does not receive acknowledgement from the broker within a preset time interval, it will
	republish the message again and again until acknowledgment is received.
	QoS 2: exactly once. The MQTT protocol uses the confirmation of confirmations to ensure that a
	message is delivered exactly once.
Retained message	By setting the Retain flag the MQTT Broker is instructed to save the most recent data value for the
	topic. Data values without Retain flag are only transferred from the MQTT Broker to those MQTT

USR-M100-HM User Manual

	Subscribers that are registered at the broker and have subscribed to the appropriate topic in the
	moment when sending the data to the broker.
IO control/Query	Used to reply for IO status to server

Table 13 Subscribe message setting

Parameter Item	Description
Transmission mode	The data printed to the serial port can be set whether to carry the Topic
Topic string	Same to Table 12
Binding port	Same to Table 12
QoS	Same to Table 12
IO control/Query	Used to Query IO status from server

3.1.6. PUSR cloud

Users can achieve remote management of the USR-M100-HM through PUSR cloud. And for PUSR cloud, users can deploy the full platform on local server(the private cloud platform).

		中文
Current Status		
Network	Cloud	
∽Port	Cloud gateway functions such as edge acquisition, edge computing and edge reporting can be realized.

System Setting		

3.1.7. IO gateway

USR-M100-HM gateway can support a number of Digital Input (DI), Digital Output (DO-Relays), Analog Input (AI) ports. There are a few combinations of I/O extension board. Because the I/O status of M100-HM is mainly displayed via Modbus protocol, the user has to configure the Modbus settings if the user wants to use the Modbus protocol. Fig.29 shows the parameter that must be set for the Modbus protocol that is the Modbus Slave ID.

On pre-configured page, user can select the extend module model based on the installation sequence.

On IO control page, users can check the I/O status and can control the ON/OFF status of DO interface.

On IO function page, users can set the filter time of DI interface and set the soft restart hold function of DO interface.

Current Status

Parameter Item	Description
Restart Hold	Whether the DO output status remains after the restart
DI filter time	By setting the filtering time, the device will automatically filter the waveform jitter of the DI
	interface, thereby eliminating the detection error caused by clutter.

|--|

3.1.8. Edge gateway

The M100-HM gateway supports southbound fieldbus protocols of Modbus RTU protocols. It also supports northbound MQTT/TCP in socket, AWS IOT, and Alibaba Cloud IoT Platform. The M100-HM gateway fulfills a different role on each of its sides. Each role is determined by your devices' settings. Therefore, set the role of each of your devices correctly.

Fig. 24 Data acquisition settings

Table 15Slave device parameters

Parameter Item	Description
Device name	Name of slave device, which is unique for the current gateway.
Detail	Detail information of the slave device.
Protocol	The are 4 options for users:
	Modbus RTU: the slave device supports Modbus RTU, and send query command in Modbus RTU.
	Modubs TCP: the slave device supports Modbus TCP, and send query command in Modbus TCP.
	DLT645/2007:the slave device supports DLT645/2007, and send query command in DLT645/2007.
	Virtual: The data point is from the virtual register.

Modbus RTU protocol	Uart: Select the serial port to which the Modbus slave device is connected.
	Slave address: the ID of slave device.
	Polling interval: the time interval between 2 consecutive query command.
	Merge acquisition: This function is used when the register address of many data points are
	sequential.
Modbus TCP protocol	Remote Server Addr: the IP address of the Modbus slave device
	Remote Port: the listening port of the modbus slave device
	Polling interval: the time interval between 2 consecutive query command.
	Merge acquisition: This function is used when the register address of many data points are
	sequential.
DLT645/2007 protocol	Uart: Select the serial port to which the DLT645/2007 slave device is connected.
	Electricity meter number: the ID of the electrical meter.

Table 16 Data point(node) configuration

Parameter Item	Description
Data point name	Identifier of the data point, which must be unique for the gateway.
Modbus function code	The Modbus RTU master supports the following Modbus functions: 1 Read Coils, 2 Read Discrete
	Inputs,3 Read Multiple Holding Registers, 4 Read Input Registers.
Register address	The first blank is for function code, and the second blank is the address of the register from which
	data will be read.
Data type	Defines how read data will be stored.
Decimal places	How many places do we keep after the decimal point
Timeout	If the Modbus device does not receive a response within the time specified here, the
	communication times out.
Collect formula	Modbus register store only whole numbers. For this reason a scale factor often needs to be
	applied. For example a modbus register with a temperature value may read as 723 and a
	multiplier of 0.1 need to be applied to get the correct value of 72.3 in the SCADA system, the
	formula is %s*0.1. If the data type is a Float then the multiplier is not needed. This computation
	supports +, -, * and / operators.
	This formula is for data collecting.
Formula of control	This formula is for data writing.
Change reporting	Enable change reporting function.
	The report is triggered if the collected data changes. You can use a tolerance to only log the data
	point if the value changes more than X amount.
Range	The report is triggered if the collected data changes. You can use a tolerance to only log the data
	point if the value changes more than preset range.

Fig. 25 Data report

Table 17Data report

Parameter Item	Description
Channel Selection	Select the channel in the socket type.
Report Topic	Whether data query from remote server or cloud is enable.
QOS	Whether data setting command from remote server or cloud is enable.
Retain Message	You can choose Modbus RTU, Modbus TCP or JSON. Users can send the right format query
	command from remote modbus master or MQTT publisher to the M100-HM gateway. The data is
	retrieved from the device's cache of corresponding modbus instructions.
Period Report	Data is automatically reported at a certain interval. The reporting interval can be configured.
Report Period	The data reporting interval.
Timer Report	In the 24-hour system, the NTP function need be enabled first to correct the device clock. Four
	types of timing logic are supported:
	Report at the exact hour: Reporting every hour from 0' clock.
	Report at the exact quarter:Reporting every 15 minutes from 0' clock.
	Report at the exact minute: Reporting every 1 minute from 0' clock.
	Report at the fixed time: Reporting data at a fixed time every day, For example, if you select 12:05,
	data is reported at 12:05 every day.
Report Data Format	Primate type: Reporting data to server by the original format.
	To string: Convert the collected data to string format to reporting to the server.
Error Fill	After data points fail to be collected, the value in the data template is replaced with the filling
	content, for example, {"temperature":"error"}.
Error Message	The payload format. Users can custom which data points should report to the server.

3.1.9. System setup

> Parameter setting

This setting tab includes several system level settings, such as host name, user name, password, web port, parameter export and parameter import. Most of these settings are optional.

Current Status

Table 18 System settings list

Parameter Item	Description
Host name	The name of the device, up to 32 characters, can't be null
User name	The user name of web console and can be modified. up to 16 characters, can't be NULL
Password	The password of web console and can be modified. up to 16 characters, can' t be NULL
Web port	The port of login page
Param Export	Export the configured parameters and users can import the file to the other device directly.
Param Import	Import the parameters to simple the configuration steps

The configuration will save to flash memory after clicking Save button. All configurations take effect after a system reboot.

> System time

Users can configure time relevant parameters on this page.

System Setting	

A. Firmware upgrade

USR IoT continually upgrades its firmware to add new features and optimize performance. Please contact the sales to obtain the latest version of the firmware. Before upgrading the firmware, please make sure that the device has a reliable power source that will not be powered off or restarted during the firmware upgrading process(please be patient as this whole process might take up to 1 -2 minutes). Choose file to upload and flashing the firmware.

B. Reset(Restore factory defaults)

This function is used to restore the gateway to the factory settings and automatically restart the gateway at the same time. Before the gateway restarts successfully, the device does not work and cannot forward any data packets. This function is to restore the factory default configuration value once the user sets the wrong parameter and causes the gateway to work abnormally. Click the "Restore factory defaults" button, and a prompt box will pop up on the page. Click "OK".

C. Restart

This function is used to restart the gateway by software. Before the gateway is completely restarted, the device does not work and cannot forward any data packets. This restart is different from the hardware reset of power-on restart, but the gateway system software is reset, just like the "warm restart" of the windows operating system. Once a new setting is changed, you can use the Save function to accept the changes. You will need to reset the device to save the settings to flash memory. Click on "restart" Button, the page pops up a prompt box, click "OK".

D. Time restart

After opening this function, the device will restart at the preset time.

3.1.10.SD card function

The USR-M100-HM supports external SD card to restore the collected data when the Internet connection is disconnected. When the SD card is not inserted, the webpage will give the status.

Current Status	
Network	System Setting

Insert the SD card like the following picture

3.2. Configuration software

3.2.1. Discovering your gateway

After you start configuration software, if the USR-M100-HM gateway is already connected to the same gateway as your PC, the device can be accessed via broadcast packets. Users can search all the USR-M100-HM gateways on the network and show them on the Deivce List Area of the utility. Please select the right Ethernet adapter(Device menu) if you did not see any gateway.

3.2.2. Network setting

Sometime the USR-M100-HM gateway might not be in the same subnet as your PC, therefore, you will have to use this utility to locate it in your environment. To configure each device, first click to select the desired device (default IP:192.168.0.7) in the list of configuration utility, and then change the IP address to avoid any IP address conflict with other hosts on your LAN, save your change.

Fig. 30 Changing network settings

3.2.3. Reboot the device

This function is available to allow you to reset the gateway. The function disconnects both the ethernet and serial connections.

The function also allows the gateway to save new configuration settings to flash memory. To reset the device:

- 1. Right-click a desired device to display the settings menu.
- 2. Select Reboot.

Press the Reboot button and the system will give a reset response.

Fig. 31 Reboot the device

3.2.4. Restore to factory default settings

The configuration utility provides the function to restore the gateway to factory default settings. If you really want to restore the gateway to factory default settings, please click restore factory button to continue. As shown in Fig.34.

3.2.5. Open web server

Users can visit the web server of the gateway conveniently with configuration tool. Select the device you want to visit and right click, then click External web config , you will open the web server with default browser such as Google Chrome. As shown in Fig.34.

4. Edge Gateway

The USR-M100-HM supports Modbus RTU Master for retrieving field site data from serial meters. After collecting data, users can convert serial data to MQTT json format data, allowing users to get field site data. This two-in-one design reduces system complexity and the amount of space required in the network topology, as well as overall installation time. In addition, you can extend the useful life of legacy devices by connecting them to Ethernet and accessing the devices using a preferred protocol,TCP/UDP , HTTP , MQTT.

First, users need to enable edge computing function.

4.4. Test result of data report

In this document, we use Modbus Slave software to replacement the real Modbus Slave device to do the test. From the TCP server side, we can notice that the data interval is 15s, it's keep the same that we set in the adding group page.

4.6. Protocol conversion

The protocol conversion function is mainly applied in the scenario where the server actively sends protocol commands to obtain data or control points from the M100.

After the M100 is connected to the server through the link of protocol conversion, the server issues standard protocol commands to realize the collection and control of all point data of the M100. Current protocol conversion including 2 protocol standards: Modbus TCP and Json.

Query data using Modbus TCP:

oochec				
MQTT	Socket Enable	Open	*

value	The valid data of the data points		
	Error code,		
err	0: The command can be operated by the USR-M100,		
	1: The command can't be operated by the USR-M100.		

To read the value of node0101 and the Humidity, we can send data like the following:

{"rw_prot":

{"Ver": "1.0.1",

"dir": "down",

"id": "12345",

"r_data": [{"name": "temperature"},{"name": "Humidity"}]

}

}

For Help, press F1.		Send Options Data from file Auto checksum Auto reply Send as HEX	<pre>("rw_prot": {"Ver": "1.0.1", "dir": "down", "id": "12345", "r_data": [{"name": "node0101"}, {"name": "Humidity"}] }</pre>	^	Send

To write the value of node0101 and the Humidity, we can send data like the following:

{"rw_prot":

```
{"Ver": "1.0.1",
```

"dir": "down",

"id": "12345",

"w_data": [{"name": "node0101", "value": "15"}, {"name": "Humidity", "value": "52"}]

}

There are 3 response data for the unoperated command:

- The USR-M100 responses no data to the command,
- The USR-M100 will response data conforming to the error protocol if the ver/dir/id is not right,

• The USR-M100 will response data conforming to the error protocol if the contents of r_data and w_data are both wrong,

the USR-M100 will response data of the right one if only one of the r_data and w_data is wrong.

The error protocol format is the following:

```
{"rw_prot": {"Ver": "1.0.1","dir": "up","err":"1"}
Tips:
```

1. If the query command is incorrect, the value of the read command reply is empty, and the value of the write command reply is the historical data value.

2. The maximum read and write operation is 127 data points at the same time.

5. PUSR cloud service

In order to reduce the length of this document, we have organized this section into a special document. Please refer to "USR-M100-HM Quick Start Guide with PUSR cloud" for detail.
